

Business Performance Dashboard Overview

An end-to-end Power BI Dashboard built with **30+ advanced DAX measures**, covering Sales, Profitability, Customer Growth, Order Performance, Returns, and Delivery Metrics — designed to transform raw data into actionable business intelligence.

"Transforming raw business data into actionable insights."

- 📄 **Speaker Notes:** Introduce the project scope and purpose. This dashboard was developed end-to-end in Power BI, using over 30 DAX measures to cover six key business domains. The goal is to demonstrate how raw operational data can be transformed into a cohesive, decision-ready analytics solution. Emphasize the breadth of metrics covered and the strategic intent behind the design.

Core KPI Framework

Six foundational metrics provide a **complete, real-time view of business health**, enabling instant performance assessment across every dimension of the operation.

\$2.4M

Total Sales

Revenue across all channels

\$480K

Total Profit

Net profitability

12.4K

Total Orders

Orders processed

3.2K

Total Customers

Active customer base

48K

Total Quantity

Units sold

\$2.1M

Gross Sales

Pre-discount revenue

- 📌 **Speaker Notes:** Walk through each KPI card and explain how these six measures form the foundation of the dashboard. They are all driven by DAX and update dynamically based on report filters. Highlight that these KPIs give stakeholders an at-a-glance view of business health — from top-line revenue down to unit-level volume. Note that the figures shown are illustrative; replace with actual project data when presenting.

Time Intelligence Analysis

■ MTD ■ QTD ■ YTD

DAX Measures Applied

- **Sales MTD** — Month-to-Date revenue tracking
- **Sales QTD** — Quarter-to-Date cumulative sales
- **Sales YTD** — Year-to-Date total performance

Time intelligence reveals **trends and seasonality**, enabling leaders to assess whether growth is consistent across the fiscal year.

Business Question: "Are we growing consistently throughout the year?"

Speaker Notes: Explain how DAX time intelligence functions (TOTALMTD, TOTALQTD, TOTALYTD) enable dynamic period comparisons without manual date filtering. The chart illustrates how MTD, QTD, and YTD accumulate across quarters — helping stakeholders spot seasonal patterns and assess whether the business is on track. Emphasize that these measures automatically adjust based on the report's date context, making them highly flexible for interactive analysis.

Growth Performance Analysis

DAX Measures Applied

- **MoM Sales Growth %** — Month-over-Month velocity
- **YoY Sales Growth %** — Year-over-Year revenue comparison
- **YoY Profit Growth %** — Profitability trajectory

Comparing current performance against prior periods identifies **acceleration or slowdown** — directly informing strategic planning and forecasting decisions.

📌 **Speaker Notes:** Discuss how growth rate measures use CALCULATE with SAMEPERIODLASTYEAR and DATEADD to enable period-over-period comparisons. MoM highlights short-term momentum, while YoY reveals longer-term trajectory. Positive YoY profit growth alongside sales growth indicates healthy margin expansion. These metrics are critical for executive reviews and board-level reporting. Note that the chart values are illustrative — replace with actual project data when presenting.

Running Trend Analysis

Rolling 3-Month Avg Running Total Sales

Running Total Sales

Cumulative revenue plotted across the fiscal year, revealing the **full trajectory of business performance** at a glance.

Rolling 3-Month Average

Smooths short-term volatility to expose the **underlying growth trend** — a reliable indicator of sustainable momentum.

Business Question: "Is our growth sustainable?"

Speaker Notes: Explain the difference between running totals and rolling averages. Running Total Sales uses CALCULATE with FILTER(ALL('Date'), 'Date'[Date] <= MAX('Date'[Date])) to accumulate revenue over time. The Rolling 3-Month Average smooths out spikes and dips, making it easier to identify genuine trend direction. This combination helps leadership distinguish between temporary fluctuations and meaningful momentum shifts.

Profitability Analysis

Sales volume alone doesn't define success. These measures reveal **true cost efficiency and margin health**, uncovering where profitability is strongest and where improvement is needed.

Total Profit

Net profit after all costs — the definitive measure of financial performance.

Profit Margin %

Profit as a percentage of revenue, enabling cross-category and cross-period comparisons.

Total COGS

Cost of goods sold — identifies cost drivers and highlights opportunities for margin improvement.

- 📌 **Speaker Notes:** Emphasize that profitability analysis goes beyond top-line revenue. Total Profit and Profit Margin % are derived using DAX measures that subtract COGS from sales, giving a true picture of financial performance. COGS breakdown helps identify which product categories or regions are dragging on margins. This slide is particularly relevant for finance stakeholders and operations leaders focused on cost optimization.

Customer & Order Performance

DAX Measures Applied

- **Total Customers** — Distinct customer count with acquisition trend tracking
- **Total Orders** — Order volume with growth pattern analysis

Together, these measures reveal **customer engagement depth**, revenue contribution patterns, and the pace of business expansion over time.

✔ **Business Value:** Measures customer engagement and business expansion.

📌 **Speaker Notes:** Walk through the combo chart showing how new customer acquisition (columns) correlates with total order volume (line) across quarters. These DAX measures use `DISTINCTCOUNT` and `COUNTROWS` to track customer and order activity. Growing customer counts alongside rising order volumes signal healthy business expansion. This analysis is especially useful for marketing and sales teams evaluating campaign effectiveness and market penetration.

Operational Efficiency

A high-performing sales engine means little without reliable fulfillment. These measures evaluate **supply chain and logistics performance**, directly tied to customer satisfaction and repeat business.

Delivered Orders

Total orders successfully fulfilled and delivered to customers on time.

Delivery Success Rate %

Percentage of orders completed without delay, damage, or failure — a direct indicator of operational reliability.

- 📌 **Speaker Notes:** Highlight that delivery performance is a leading indicator of customer satisfaction and retention. Delivery Success Rate % is calculated as Delivered Orders divided by Total Orders, expressed as a percentage. A declining rate signals operational bottlenecks that need immediate attention. This slide resonates strongly with operations managers and logistics stakeholders who are accountable for fulfillment KPIs.

Risk & Loss Analysis

Issue Type

DAX Measures Applied

- Returned Orders & Return Rate %
- Cancelled Orders & Cancellation Rate %

These measures pinpoint **revenue leakage and operational weaknesses** before they escalate into systemic problems.

Recommendations

- Reduce cancellations through improved order confirmation flows
- Improve product quality to lower return rates
- Strengthen fulfillment processes to minimize errors

📌 **Speaker Notes:** Frame this slide around risk mitigation. Return Rate % and Cancellation Rate % are calculated as a proportion of total orders, making them comparable across time periods and segments. High return rates may indicate product quality issues, while elevated cancellations often point to checkout friction or inventory problems. These DAX measures enable proactive identification of revenue leakage — a key concern for operations and finance leadership.

Key Findings & Recommendations

→ Improve High-Performing Categories

Double down on product lines and segments driving the strongest sales and margin contribution.

→ Reduce Return & Cancellation Rates

Address root causes of revenue leakage through quality and process improvements.

→ Focus on Profitable Customer Segments

Prioritize acquisition and retention efforts on high-value, high-margin customer groups.

→ Strengthen Logistics Performance

Invest in fulfillment infrastructure to sustain delivery success and customer satisfaction.

→ Use Predictive Analytics for Forecasting

Leverage historical DAX trends to build forward-looking models for proactive planning.

"Advanced DAX calculations transformed operational data into strategic business intelligence, enabling smarter and faster decision-making."

- ❏ **Speaker Notes:** Summarize the five key recommendations and tie each back to specific DAX measures demonstrated throughout the presentation. Reinforce the central message: advanced DAX is not just a technical skill — it is a strategic enabler that turns raw data into a competitive advantage. Close by inviting questions about the dashboard methodology, DAX logic, or how these insights can be applied to the audience's business context.
